

# Accelerating developer productivity with Gradle

**Gr8Conf US 2017**

CRAIG ATKINSON, PRINCIPAL ENGINEER, GRADLE INC.

# About me

- Craig Atkinson
- Principal Engineer @ Gradle, Inc.
- Gradle Enterprise
- [craig@gradle.com](mailto:craig@gradle.com)
- [@craigatk1](https://twitter.com/craigatk1)
- [github.com/craigatk](https://github.com/craigatk)

# Agenda

- Intro
- Faster builds
  - Incremental compiler, build cache, etc.
- Easier local development
  - Composite builds, tooling API, etc.
- Deep build insights
  - Build scans, Gradle Enterprise

# Gradle 1-min intro

# Gradle build execution

2-phase build:

Configuration phase → build task graph

Execution phase → execute task graph

# build.gradle

```
apply plugin: 'java-library'

repositories {
    jcenter()
}

dependencies {
    api 'org.apache.commons:commons-math3:3.6.1'
    implementation 'com.google.guava:guava:21.0'
    testImplementation 'junit:junit:4.12'
}

task greeting(type: DefaultTask) {
    doLast {
        println "Hello Gr8Conf US 2017!"
    }
}
```

Gradle 1-min intro

Demo

Incremental builds

# Incremental builds

The fastest task is the one you don't need to execute

Only re-run tasks affected by changes made between build executions

Keep output from up-to-date tasks

Incremental builds

Demo

Build cache

# Build cache

- Reuse outcomes of **any** previous run
  - Rather than just the last
- Local cache and remote cache
- Task outputs are cached

# Build cache

Calculate cache key from inputs, use output as cache value

Inputs → Task → Output

Example for Compile task:

Cache key: hash(source files, compiler flags, etc.)

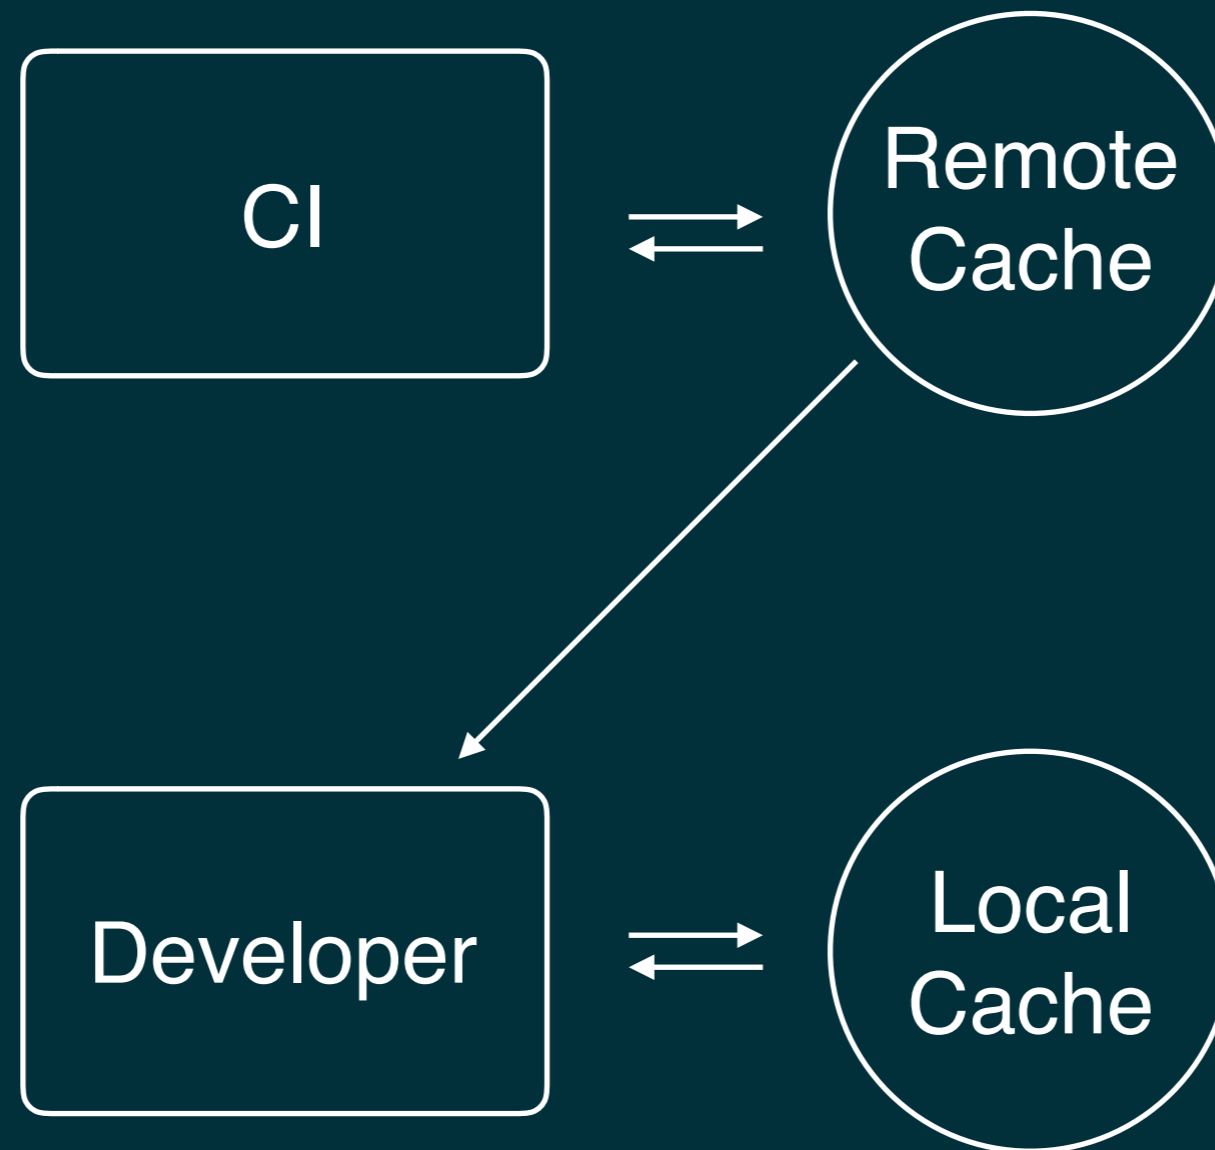

Cache value: fileTree(class files)

Build cache

# Demo

# Build cache

# Build cache

```
buildCache {  
    local {  
        enabled = !isCI  
    }  
    remote(HttpBuildCache) {  
        url = "https://my.ge.server/cache/"  
        push = isCI  
    }  
}
```

# Build cache in Gradle build

# Compile avoidance & incremental compiler

# Compile avoidance & incremental compiler

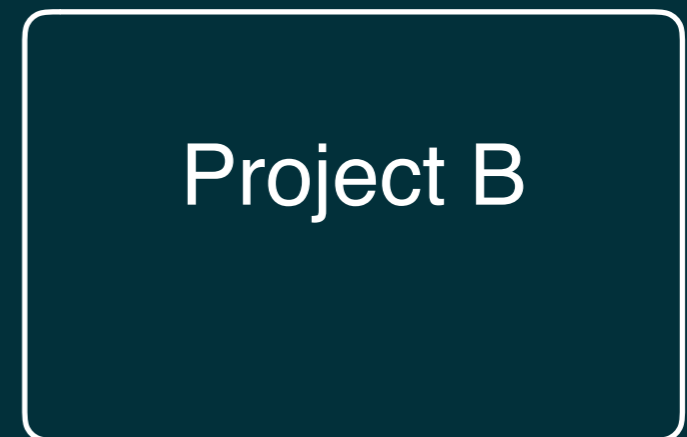

**Save time** by only recompiling the **minimum number** of source files needed for a given change

# Compile avoidance

recompile

unchanged

# Incremental compiler

- Analyze class dependencies to optimize which classes are recompiled
- Fast in-memory cache of class ABIs inside daemon

# Enable incremental compiler

```
tasks.withType(JavaCompile) {  
    options.incremental = true  
}
```

# Compile avoidance & incremental compiler

# Compile avoidance & incremental compiler

General performance  
improvements

# General performance improvements

- Faster configuration time
- Parallel dependency downloads
- Parallel task / action execution by default

Gradle daemon

# Gradle daemon

Gradle builds executed much more quickly by a long-lived background process that avoids expensive bootstrapping and leverages caching

# Gradle daemon resources

- [Gradle daemon user docs section](#)

# Worker API

# Worker API

- Previously tasks in different projects can run in parallel
- New API to run task actions in single project in parallel safely
- Parallel actions cannot mutate shared state

# Example worker

```
import javax.inject.Inject

class ReverseFile implements Runnable {
    File fileToReverse
    File destinationFile

    @Inject
    public ReverseFile(File fileToReverse, File destinationFile) {
        this.fileToReverse = fileToReverse
        this.destinationFile = destinationFile
    }

    @Override
    public void run() {
        destinationFile.text = fileToReverse.text.reverse()
    }
}
```

```

class ReverseFiles extends SourceTask {
    final WorkerExecutor workerExecutor

    @OutputDirectory
    File outputDir

    // The WorkerExecutor will be injected by Gradle at runtime
    @Inject
    public ReverseFiles(WorkerExecutor workerExecutor) {
        this.workerExecutor = workerExecutor
    }

    @TaskAction
    void reverseFiles() {
        source.files.each { file ->
            workerExecutor.submit(ReverseFile.class) { WorkerConfiguration config ->
                // Use the minimum level of isolation
                config.isolationMode = IsolationMode.NONE

                // Constructor parameters for the unit of work implementation
                config.params = [ file, project.file("${outputDir}/${file.name}") ]
            }
        }
    }
}

```

# Worker isolation levels

- NONE - runs in same thread, minimum isolation
- CLASSLOADER - runs in thread with isolated classloader
- PROCESS - runs in separate process, maximum isolation

# Worker API resources

- [Video of Gradle Summit presentation on worker API](#)
- [Worker API documentation](#)

Continuous build

# Continuous build

- Gradle watches for file changes, re-runs tasks
- Run Gradle with `-t`

Continuous build

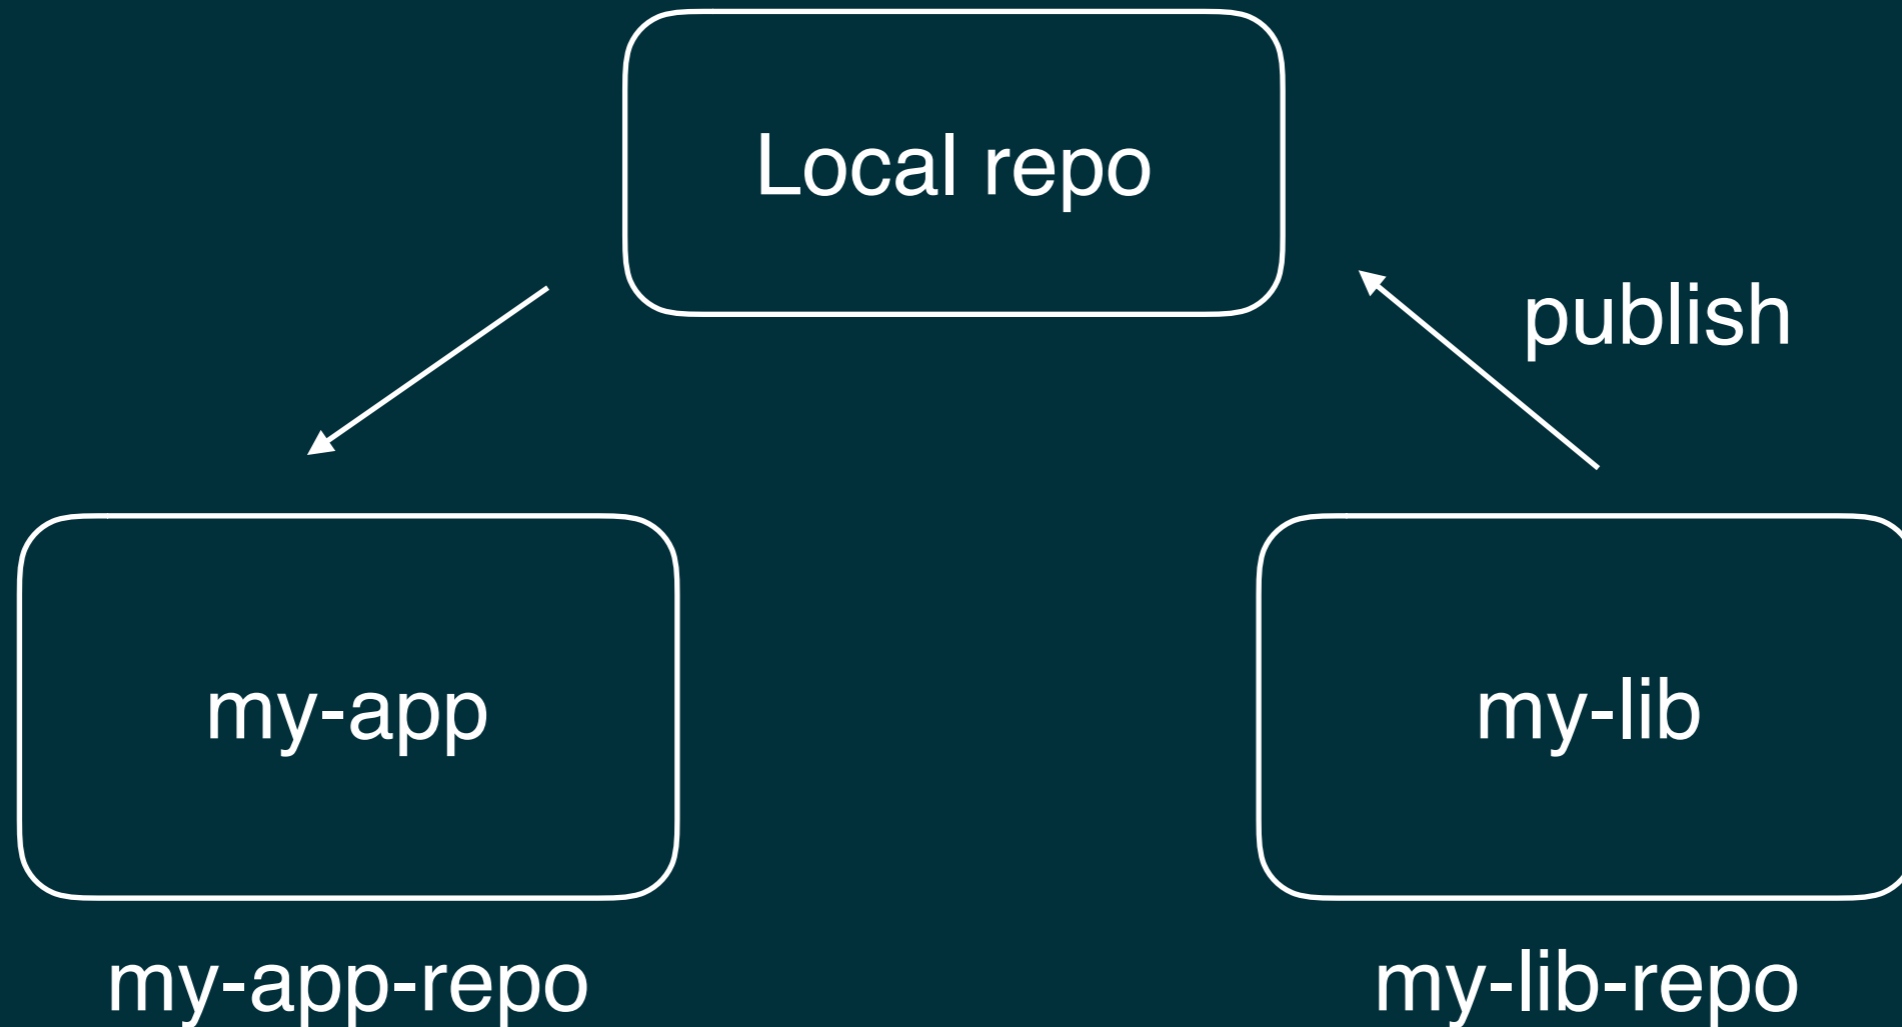

Demo

# Continuous build resources

- [Blog post introducing continuous build](#)
- [Continuous build user docs](#)

# Composite builds

# Multi-repo change

# Composite build

# Composite builds

- Fix a bug in a library used by app
- Break down a monolith into multiple repos
- Consume latest state of libraries in integrations builds

# Use composite builds

## Command line

```
gradle --include-build ../my-utils run
```

## settings.gradle

```
rootProject.name='my-app'  
  
includeBuild '../my-utils'
```

# Composite build resources

New Gradle console

# Parallel tasks console demo

A terminal window with a white background and a dark border. The title bar shows three colored circles (red, yellow, green) on the left and the text "ewendelin@rydia: ~/src/testing/gradle" on the right. The main area contains a single line of text: a purple prompt character followed by the command `./gradlew :core:compileTestGroovy` and a cursor. A mouse cursor is visible on the right side of the terminal.

```
ewendelin@rydia: ~/src/testing/gradle  
> ./gradlew :core:compileTestGroovy
```

# Parallel tests console demo

```
┌ ./.gradlew :logging:test  
<=====--> 99% EXECUTING [17s]  
> :logging:test > 0 tests completed  
> IDLE  
█
```

Build scans

# Build scans

## Deep insights into a build execution

- Details about build failures
- Visual timeline of which tasks ran and in which order
- Details on why tasks were executed (up-to-date reasons)
- Which dependencies were used
- Performance analysis of configuration, execution, etc.
- Attach custom data to your builds (Git commit, CI or local, Checkstyle errors, etc.)

# Build scans

## Improve build performance

- Quickly identify places in your build to optimize
- Find slowest tasks, long build configuration time, long dependency download times, etc.
- See which tasks are and aren't cacheable
- Identify slowest tests

# Build scans

## Collaborate with colleagues and the community

- Easily share exactly what happened in when your build ran (tasks, tests, etc.)
- Build environment (JDK, OS, CLI switches, etc.)
- Share exact links to many different parts of the build scan (specific task, test, dependency, console output line, etc.)

Build scans

Demo

# Build scan resources

**Build scans are a free service for everyone!**

# Gradle Enterprise

# Gradle Enterprise

- Build scans + search + comparison + more
- Scalable, high-performance build cache backend
- Hosted on-premise

# Search build scans

- Search based on project, tasks executed, start time, custom tags and values, etc.
- Find build scans to compare

Search build scans

Demo

# Compare build scans

- Compare build scans to find differences between builds
- Dependencies, task inputs, custom values, environment, etc.

Compare build scans

# Demo

# Build cache backend

- High-performance, scalable build cache backend
- Build cache backend supports multiple, distributed nodes

Build cache UI

# Demo

# Gradle Enterprise

- Gradle Enterprise is a commercial offering
- Learn more: [gradle.com/enterprise](https://gradle.com/enterprise)

# Summary

- Incremental builds
- Build cache
- Compile avoidance & incremental compiler
- Worker API
- Daemon
- Continuous builds
- Composite builds
- Tooling API / IDE integration
- Build scans
- Gradle Enterprise
